

SHRINATH PRABHU

Senior Staff Frontend Engineer | Vue • React • TypeScript • Node.js

Mumbai, India · Remote (8+ years in software engineering)

shrinath.me | hello@shrinath.me | [Github](#) | [LinkedIn](#)

PROFESSIONAL SUMMARY

Strategic frontend leader with 8+ years of experience architecting and scaling Web3 and SaaS infrastructure through a company acquisition. I build products from zero to launch, 4 Chrome Extensions shipped to Chrome Web Store with 100% approval rate, a cross-chain transfer app that scaled to 65K+ accounts and 20K+ peak daily active users, and developer platforms serving Web3 builders. Led frontend engineering at Arcana Network for 4.5 years from seed stage through acquisition by Avail Project. Deep expertise in Vue, React, TypeScript, Node.js, and Chrome Extension architecture. I use AI-augmented development workflows (Claude Code, Cursor, Codex) daily to accelerate engineering output.

EXPERIENCE

AVAIL (<https://availproject.org>)

Senior Staff Engineer

August 2025 – Present | Remote (Dubai)

- Own frontend architecture and technical strategy across Avail's product ecosystem, establishing component libraries, CI/CD standards, and architectural patterns across 3+ core product surfaces.
- Conceived, architected, and secured executive buy-in for **Nexus One**, a unified component system that consolidates multiple product interfaces into a single configurable element, enabling developers to render complex multi-product UIs from a single config object.
- Architected and shipped **Nexus Fastbridge**, a cross-rollup bridge UI handling high-frequency state updates for cross-chain asset transfers. Engineered a custom Vite-based SEO solution that generates per-chain HTML pages at build time, achieving full SEO capability without the overhead of Next.js.
- Leading frontend migration to **Nexus v2**, a next-generation backend driven architecture leveraging EIP-7702 to reduce signature requirements and shift swap/bridge execution server-side via ephemeral wallets.

- Shipped Nexus SDK Injector to Chrome Web Store, a Chrome Extension that injected Avail's chain abstraction SDK into third-party DeFi platforms (Hyperliquid, Pendle, Yearn, Scroll), used as a client demo tool.

ARCANA NETWORK (<https://arcana.network>)

(Acquired by Avail Project, 2025)

Lead Frontend Engineer

January 2021 – August 2025 | Remote (Dubai)

- Led the frontend engineering function for 3 engineers across 4.5 years, from seed stage through the successful acquisition by Avail Project. Defined technical standards, established code review processes, and ensured seamless transition of all IP and infrastructure during the acquisition.
- Built **Arcana's Chrome Extension Wallet** from scratch, a non-custodial sidebar wallet supporting 10+ blockchains, transaction signing, dApp injection (Aave, Uniswap, Lido, Hyperliquid), and unified cross-chain balance management. Grew to **750+ users with a 4.7★ rating** on Chrome Web Store during a crypto bear market. Engineered the provider injection and communication layer by studying MetaMask's architecture and building a fully compatible system using Vue and viem. Technology later extracted into a TypeScript SDK for B2B distribution.
- Built **SendIt**, a gamified cross-chain token transfer app that replaced wallet addresses with email, X handles, and ENS domains. Scaled to 65K+ accounts and 20K+ peak daily active users. Traffic exhausted Netlify Pro plan limits despite aggressive caching, I migrated the entire frontend infrastructure to a self-managed AWS setup to handle peak loads and reduce hosting costs. Backend required concurrent server upgrades and X API rate limit management. Included a reward points system with daily/monthly leaderboards, anti-farming safeguards, and NFT-based rewards.
- Architected **Arcana's Developer Dashboard** from scratch, the primary interface for Web3 developers to register dApps, configure authentication providers (Google, Twitter, GitHub, Cognito), manage decentralized storage settings, and customize the embedded wallet's appearance and behavior. Built with Vue 3, TypeScript, and Chart.js.
- Shipped **Skizzle** within the first month of joining, a Chrome Extension and web app for end-to-end encrypted email attachments. Leveraged InboxSDK and gmail.js for Gmail DOM observation, RSA keys generated via Web3Auth (Torus), and decentralized storage for encrypted file retrieval. Built for both Chrome and Firefox, reaching **approximately 1,000 users with a 4.2★ rating** before the company pivoted.

- Migrated marketing sites through WordPress → Nuxt → Webflow → Framer, eliminating the frontend engineering bottleneck for marketing initiatives and transferring full ownership to the design team, freeing up engineering dependency.

HASHBINARY SERVICES (<https://hashbinary.com>)

Full Stack Developer

April 2018 – January 2021 | Mumbai (Hybrid)

- Architected **Pricingr**, a privacy-focused Chrome Extension leveraging **multi-region VPN proxies** (Node.js backends deployed across AWS regions in Albania, Slovenia, India, Greece), geolocation blocking, user agent spoofing, cookie/storage clearance, and DNT enforcement to bypass dynamic pricing manipulation on booking and shopping sites. Built an automated crawler/scrapper system that identified optimal privacy settings per-site, powering a **one-click "Optimize" feature**. Reached **approximately 1,000 users with a 4★ rating** before COVID related budget constraints halted the project.
- Built backend APIs and dashboards for enterprise clients: **Jagran** (India's largest media conglomerate, Angular dashboard with demographic and psychographic analytics and Chart.js visualizations), **QBuild** (previously FastBuild, construction project management tool with interactive floor plan annotation where engineers mark defects and track repairs with status workflows on uploaded blueprints), and **8SQM** (New Zealand-based car wash booking platform using GeoJSON for nearest station discovery).
- Led end-to-end development of **Agrostar's** farmer learning platform MVP within a week (as a dedicated resource), a mobile-first app supporting 5 Indian languages with auto-switching video, audio and subtitles, built with React, Nest.js, TypeScript, and Firestore. The VP offered a full-time retainer role based on delivery speed and quality.

INDEPENDENT PROJECTS & OPEN SOURCE

- **Outline Analytics** (Founder & Developer): Building a privacy-first, cookie-free web analytics platform. Architecture: TypeScript SDK (<4KB gzipped, zero dependencies), Bun + Elysia.js backend, MongoDB timeseries collections. Planned migration to ClickHouse for analytical queries. Designed as a self-hostable, open-source alternative to Plausible and Fathom.
<https://github.com/useoutline>
- **Credenstore**: Serverless zero-knowledge encrypted storage, users encrypt data client-side with a password using Triplesec symmetric encryption, upload to

Firestore, and share via link + password. Supports file encryption, time-bound expiry, and requires no login or backend.

SKILLS

- **Architecture & Strategy:** Vue 3, Nuxt 3, React, TypeScript, Chrome Extension Architecture (Manifest V3, content scripts, service workers, script injection), Design Systems, Technical Roadmapping, Team Leadership
- **AI-Augmented Development:** Claude Code, Google Codex, Cursor, AI-assisted code review, prompt engineering for development workflows
- **Backend & Data:** Node.js, Bun, Express, Fastify, Nest.js, Elysia.js, MongoDB, PostgreSQL, Firebase/Firestore, REST API Design
- **Infrastructure:** AWS (EC2, S3, CloudFront, Route53), Vercel, Netlify, GitHub Actions, CI/CD Pipelines
- **Domain:** Web3 (non-custodial wallet architecture, cross-chain bridging, chain abstraction, dApp injection, EIP-7702), Client-Side Encryption (Triplesec, RSA, zero-knowledge patterns), Privacy-First Analytics

NOTABLE ACHIEVEMENTS

- Led frontend engineering through a successful company acquisition (Arcana Network → Avail Project, 2025), ensuring complete technical continuity and IP transition.
- **Shipped 4 Chrome Extensions to Chrome Web Store with 100% approval rate**, a non-custodial wallet (4.7★), an end-to-end encrypted email tool (4.2★), a privacy-focused pricing optimizer (4★, 1,000+ users), and a DeFi SDK injector.
- **Built SendIt to 65K+ accounts and 20K+ peak DAU**, traffic exceeded Netlify Pro plan limits, requiring full infrastructure migration to self-managed AWS.
- **Authored "Vue 3 Composition API: Basics and Patterns"**, ranks on the first page of Google for Vue 3 composition API searches.
- Open-source CSS architecture demo, **5,000+ views on CodePen**.
